Part 2 「解法」總整理

(一) n^{th} order linear DE 的 series solutions 解法

$$a_n(x)y^{(n)} + a_{n-1}(x)y^{(n-1)} + \dots + a_1(x)y' + a_0(x)y = 0$$

$$y^{(n)} + P_{n-1}(x)y^{(n-1)} + \dots + P_1(x)y' + P_0(x)y = 0 \quad P_m(x) = \frac{a_m(x)}{a_n(x)}$$

(Case 1) 條件：當 x_0 為 ordinary point 時

方法：假設 $y(x) = \sum_{n=0}^{\infty} c_n(x-x_0)^n$ ，代入原式

流程：5 個 steps，參考講義 344 頁，

範例：講義 345-353 頁

Interval of convergence 的判斷方法：

(1) 找出 $\lim_{n \rightarrow \infty} \frac{c_{n+1}}{c_n} < 1$ 的條件 (較嚴謹，較正確)

(2) 直接把 interval of convergence 寫成 $|x-x_0| < R$, R 是 x_0 和最近的 singular point 之間的距離

(Case 2) 條件：當 x_0 為 regular singular point 時

方法：假設 $y(x) = \sum_{n=0}^{\infty} c_n(x-x_0)^{n+r}$ ，代入原式

流程：7 個 steps，參考講義 362-363 頁，

範例：講義 370-378 頁

註：**Case 2** (x_0 為 regular singular point 時) 又根據 **indicial equations** 分成三種情形

indicial equations: $(x-x_0)^p$ 當指數 p 為最小的這一項的係數，

稱作 indicial equations，參考講義 364 頁

以下針對 2nd order DE 的情形作討論

(此時 indicial equations 有 r_1, r_2 兩個 roots)

(Case 2-1) $r_1 \neq r_2$ and r_1, r_2 are real, $r_2 - r_1 \neq \text{integer}$

兩個解都為 $y(x) = \sum_{n=0}^{\infty} c_n(x-x_0)^{n+r}$ 的型態，可直接用講義 362 頁的方法

(Case 2-2) $r_1 \neq r_2$ and r_1, r_2 are real, $r_2 - r_1 = \text{integer}$

(A) 先用講義 362 頁的方法嘗試能否解出 $y(x) = \sum_{n=0}^{\infty} c_n (x - x_0)^{n+r}$ 的型態的兩個

independent solutions

(B) 若用講義 362 頁的方法只能得出一個 independent solution $y_1(x)$

$$y_1(x) = \sum_{n=0}^{\infty} c_n (x - x_0)^{n+r}$$

則必需根據 $y_2(x) = y_1(x) \int \frac{e^{-\int P(x)dx}}{y_1^2(x)} dx$ 和長除法解出第二個 independent

solution $y_2(x)$

(Case 2-3) $r_1 \neq r_2$ and r_1, r_2 are complex, 不在本書討論範圍

(二) Laplace transform 解 DE 的方法

方法：

DE → Laplace transform → 計算 → 分解因式(若需要的話) → inverse Laplace transform

範例：講義 442, 443 頁

主要精神：把微分簡化為乘法

- DE → Laplace transform :

$$a_n y^{(n)}(x) + a_{n-1} y^{(n-1)}(x) + \dots + a_1 y'(x) + a_0 y = g(x) \rightarrow P(s)Y(s) = Q(s) + G(s)$$

$P(s)$: 即 auxiliary function, $Q(s)$: 來自 initial conditions

計算 $Q(s)$ 的快速法

參考講義 444, 445 頁

- 分解因式的方法 (Cover up method)

$$\frac{K(s)}{(s-a_1)(s-a_2)\cdots(s-a_n)^2 \cdots \cdots (s-a_N)} = \frac{A_1}{s-a_1} + \frac{A_2}{s-a_2} + \cdots + \frac{A_n + B_n(s-a_n)}{(s-a_n)^2} + \cdots + \frac{A_N}{s-a_N}$$

a_1, a_2, \dots, a_N 互異

則 $A_n = \left. \frac{K(s)}{(s-a_1)(s-a_2)\cdots(s-a_{n-1})(s-a_n)(s-a_{n+1})\cdots(s-a_N)} \right|_{s=a_n}$

$$B_n = \left. \frac{d}{ds} \frac{K(s)}{(s-a_1)(s-a_2)\cdots(s-a_{n-1})(s-a_{n+1})\cdots(s-a_N)} \right|_{s=a_n}$$

(三) Systems of Linear First-Order Differential Equations 的解法

假設我們可以把問題變成

$$\frac{d}{dt}x_1(t) = a_{11}(t)x_1(t) + a_{12}(t)x_2(t) + \dots + a_{1n}(t)x_n(t) + f_1(t)$$

$$\frac{d}{dt}x_2(t) = a_{21}(t)x_1(t) + a_{22}(t)x_2(t) + \dots + a_{2n}(t)x_n(t) + f_2(t)$$

:

:

:

:

$$\frac{d}{dt}x_n(t) = a_{n1}(t)x_1(t) + a_{n2}(t)x_2(t) + \dots + a_{nn}(t)x_n(t) + f_n(t)$$

($\frac{d}{dt}x_m(t)$ ($m = 0, 1, \dots, n$) 的係數皆為 1)

先改寫成 $\mathbf{X}' = \mathbf{AX} + \mathbf{F}$

$$\mathbf{X} = \begin{bmatrix} x_1(t) \\ x_2(t) \\ \vdots \\ x_n(t) \end{bmatrix} \quad \mathbf{A} = \begin{bmatrix} a_{11}(t) & a_{12}(t) & \cdots & \cdots & a_{1n}(t) \\ a_{21}(t) & a_{22}(t) & \cdots & \cdots & a_{2n}(t) \\ \vdots & \vdots & \ddots & & \vdots \\ \vdots & \vdots & & \ddots & \vdots \\ a_{n1}(t) & a_{n2}(t) & \cdots & \cdots & a_{nn}(t) \end{bmatrix} \quad \mathbf{F} = \begin{bmatrix} f_1(t) \\ f_2(t) \\ \vdots \\ f_n(t) \end{bmatrix}$$

[第一種解法]：使用 Sections 8-2, 8-3

(詳細規則，請參考前面所整理的公式表)

(A) Homogeneous 的部分的解 (Section 8-2)

$$\mathbf{X}' = \mathbf{AX}$$

先找 eigenvalues and eigenvectors of \mathbf{A}

$$\mathbf{AK}_a = \lambda_a \mathbf{K}_a \quad a = 1, 2, \dots, n$$

λ_a : eigenvalues, \mathbf{K}_a : eigenvectors,

再根據講義 526-528 頁的規則，來找出 n 個 linearly independent eigenvectors

(B) Particular solutions (Section 8-3)

(方法 1) Undetermined coefficients (用猜的) (講義 564-570 頁)

(方法 2) Variation of parameters (講義 571-576 頁)

(C) Homogeneous 的部分的解和 Particular solutions 相加，即為 $\mathbf{X}' = \mathbf{AX} + \mathbf{F}$ 的解

[第二種解法]

Matrix exponential e^{Λ} (Section 8-4)，不建議使用
(詳細規則，請參考前面所整理的公式表)

(四) 用 Fourier Series 來解 Particular Solutions

精神：當 $f(t) = f(t-p)$ 時，將 $f(t)$ 表示成 $\cos\left(\frac{n\pi}{p}t\right)$, $\sin\left(\frac{n\pi}{p}t\right)$ 的 linear combination

流程：見講義 645, 646 頁

範例：見講義 647-650 頁

(五) Partial Differential Equations 的解法 (一)

用 Separation of Variables

精神：例如當 independent variables 為 x and y 時，

假設 $u(x, y) = X(x)Y(y)$ ，代入原式

使得 PDE —————→ ODE

流程：7 個 Steps, 講義 717-719 頁 (非常重要，請熟悉)

注意：(1) 其中 Steps 3, 4, 5 要分成不同的 cases 來解

(2) 處理 boundary value problems 時，

要將 Steps 3, 4, 5 所有的解都加起來 (Step 6)

(3) 經常把 $d_1 e^{2\alpha x} + d_2 e^{-2\alpha x}$ 表示成 $c_4 \cosh(2\alpha x) + c_5 \sinh(2\alpha x)$

(4) “等於零”的 IVP 或 BVP 先於 Steps 3, 4 處理

例如， $u(L, y) = 0 \rightarrow X(L) = 0$

$$\left. \frac{\partial u}{\partial y} \right|_{y=b} = 0 \rightarrow Y'(b) = 0.$$

“不等於零”的 IVP 或 BVP，要在 Step 7 當中處理

(5) 當 IVP, BVP 皆不為零時，要用 superposition principle 分成兩個子問題

(參考講義 771, 772 頁)

(6) 其他需注意的地方：整理於講義 775-778 頁

範例：講義 722-725 頁 (無 boundary condition)

講義 745-753 頁的 wave equation

講義 761-769, 770, 772-774 頁的 Laplace's equation

Sections 12.1, 12.2, 12.4, 12.5 的練習題

(六) Partial Differential Equations 的解法 (二)

用 Fourier Transform (或 Fourier Cosine, Sine Transforms)

精神：藉由 Fourier transform (或 Fourier cosine transform , Fourier sine transform) , 將針對其中一個變數的偏微分變成乘法

方法： (A) interval 為 $-\infty < v < \infty$ 時 → 用 Fourier transform

(B) interval 為 $0 < v < \infty$

而且有 $u(v, \dots) = 0$ when $v = 0$ 的 initial condition 時

→ 用 Fourier sine transform

(C) interval 為 $0 < v < \infty$

而且有 $\frac{\partial}{\partial v} u(v, \dots) = 0$ when $v = 0$ 的 initial condition 時

→ 用 Fourier cosine transform

流程： 5 個 Steps, 講義 696 頁 (有一些複雜，請多練習)

範例： 講義 697-703 頁及 Section 14-4 的練習題

需注意的地方：整理於講義 704, 705 頁

(尤其注意其中第五點)
